EXPERIENCE

Jane Technologies — Software Engineer

October 2022 - October 2025

- **Designed and launched the first version of a Remix SSR storefront platform**, enabling merchants to create customizable, SEO-optimized storefronts that improved discoverability while preserving brand identity. Adopted by over 20 merchants.
- **Built a scalable frontend filtering system** supporting complex multi-facet interactions, persistent state, and deep linking, improving product discoverability and creating a smoother browsing experience for users.
- **Developed a web crawler to extract and populate customer-provided footer content**, automating the setup of storefront branding, navigation, and legal information and significantly reducing manual onboarding work.
- **Built a responsive, accessible carousel component** to showcase user-uploaded images with smooth interactions and optimized rendering across desktop and mobile devices.
- **Collaborated closely with product, design, and engineering teams** to shape feature requirements, make architectural decisions, and deliver customer-facing features from concept through launch and iteration.
- **Contributed across the stack by extending backend APIs** and debugging data flow issues when existing services did not meet frontend product requirements.

Scarf — Frontend Engineer

October 2020 - April 2022

- **Helped build the first version of the Scarf frontend application** in Vue, onboarding early customers onto the platform and establishing the foundation for the product experience.
- **Designed and implemented analytics dashboards** that visualized package download metrics through interactive graphs and filtering tools, enabling users to better understand usage trends and engagement data.
- **Led many of the initial UI/UX decisions** for the platform in the absence of a dedicated designer, creating intuitive user flows and scalable interface patterns for the first iteration of the product.
- **Collaborated closely with backend engineers** to define API and data requirements needed to support frontend metric visualizations and reporting features.
- **Introduced Rollbar instrumentation** to establish frontend error monitoring and improve visibility into production issues and application reliability.
- **Implemented Google Analytics tracking** to better understand user behavior, navigation patterns, and feature engagement across the platform.

SKILLS

Frontend - React, React Native, Vue, TypeScript, JavaScript, HTML, CSS, Remix, Next.js

Backend - Node.js, Express, Ruby on Rails, GraphQL, REST APIs

Testing & Monitoring- Jest, Playwright, Rollbar, Google Analytics

Cloud & Infrastructure: AWS

Tools & Design: Cursor, Github Copilot, Claude, Git, Figma

EDUCATION

New York University - M.S. Computer Science, 3.5 GPA, graduated January 2020

University of California, Santa Barbara - B.S. Financial Mathematics and Statistics, graduated June 2016

Wonderschool — Software Engineer

March 2020 - April 2020

- **Developed user-facing features for a React Native mobile application** using Expo and Apollo GraphQL, including profile pages and avatar-related functionality across iOS and Android platforms.
- Worked with GraphQL-based data flows and frontend state management to support responsive, data-driven application experiences.

Alpha and Omega Computer — Software Developer

April 2018 - August 2018

- **Built a shuttle management web application** from scratch in Node.js, supporting airport transportation scheduling and operational workflows for the business.
- **Overhauled the frontend of the company's ASP.NET-based CMS platform**, improving usability and modernizing the interface for local factory and business clients using the software in day-to-day operations.
- Collaborated with stakeholders to implement customer-requested functionality and improve workflows across internal and client-facing tools.
- Contributed across both frontend and backend development in a fast-paced environment, balancing feature delivery, usability, and maintainability.

AAY Solutions — Assistant Software Developer

April 2017 - March 2018

- Developed browser-based games using Phaser.js, contributing to gameplay systems, physics mechanics, and user-facing features across multiple projects.
- Built gameplay functionality for *Cat.IO*, a multiplayer .io-style game featuring real-time movement and interactions in a browser environment.
- Developed a high score and leaderboard experience for *Froggie*, helping surface player progression and engagement data within the game experience.
- Contributed to gameplay physics and puzzle interactions for a dungeon-style puzzle game, focusing on responsive controls and player experience.
- Collaborated with developers and designers in an iterative environment to rapidly prototype and improve gameplay features.
